Abstract

Generative AI systems have transformed cultural production by enabling large-scale generation of multimodal content. However, this transformation has introduced a structural problem: the disappearance of traceable human intervention in the final artifact. This paper proposes the Delta of Intent (ΔM) as a structural measure of the difference between raw AI-generated output and the final human-edited artifact. A structured observational study across three LLMs (N=24) shows that structured metadata correlates with increased representational consistency of a low-volume digital entity. Responsible AI use should be understood as documentation of transformation processes rather than attribution of generation.

Keywords: Delta of Intent, micro-editing, generative AI, Native AI Branding, Entity Life Cycle, Entity-Based Branding, AEO, Inna Story

1. Introduction

Generative AI systems decouple authorship from production. This work builds on Native AI Branding, Entity Life Cycle (ELC), and Entity-Based Branding (Udalaya, 2026a; 2026b; 2026c).

2. The Delta of Intent

ΔM = difference between raw AI output and final human-edited artifact

3. Methodology and Case

Three LLMs, entity-based prompts (N=24). Entity: Inna Story (Cinematic Pop). Structured metadata increased representational consistency. Related analysis of identity entropy: Udalaya (2026d).

4. Conclusion

ΔM is a structural measure of human intervention. Metadata structuring is associated with increased representational consistency of low-volume digital entities.
